# Recap RTOS – SW7

Domenico Colucci HSLU T&A - Infotronik FS12

#### Reasons for a RTOS

- Solving of synchronization problems
- OS makes applications scalable

## Advantages / Disadvantages

+

- Reliability
- Simplified programming of complex hardware
- hardware abstraction

\_

- needs resources
- Complexity for small programs

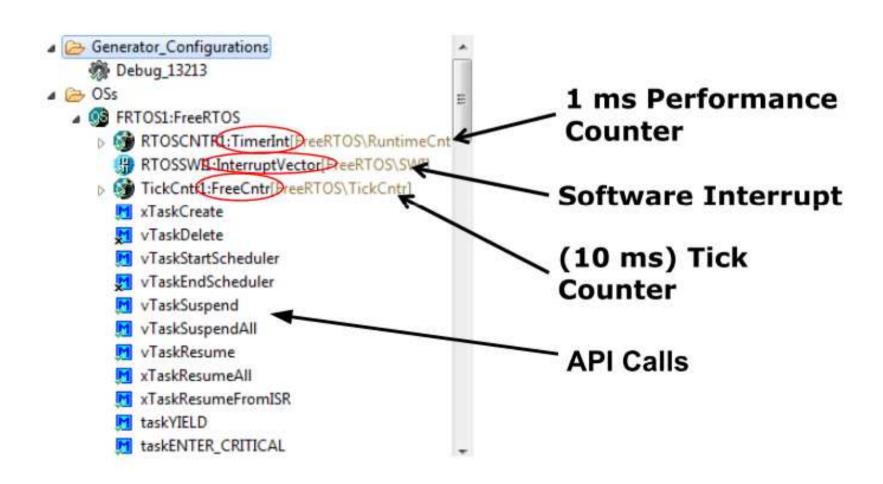

#### Free RTOS

- Simple, Portable, Royalty free, Concise
- Micro Real-time Kernel
- Choice of RTOS scheduling policy: Pre-emptive or Cooperative
- Messages Queue
- Semaphores (via macros)
- RTOS kernel uses multiple priority lists
- Ports are available for the most important microcontroller manufacturer

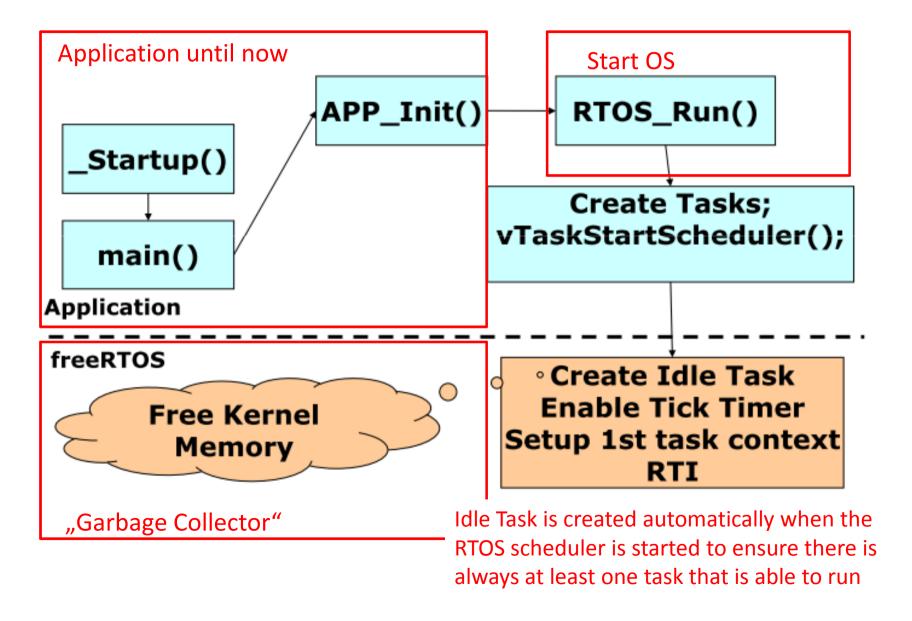

### Pre-emptive vs. Cooperative

- Pre-emptive: Always runs the highest available task. Tasks of identical priority share CPU time
- Cooperative: Context switches only occur if a task blocks, or explicitly calls yield.

#### **Processor Expert Component**

## System Startup

#### FreeRTOS Events

- FRTOS1\_vApplicationStackOverflowHook
- FRTOS1\_vApplicationTickHook
- FRTOS1\_vApplicationIdleHook
- FRTOS1\_vApplicationMallocFailedHook
- Idle Hook will only get executed when there are no tasks of higher priority that are able to run<sup>1</sup>
- **Tick Hook** optionally called by tick interrupt <sup>1</sup>
- Malloc Failed problems caused by lack of heap memory <sup>1</sup>
- Stack Overflow assists in the detection and correction of stack overflows<sup>2</sup>

<sup>&</sup>lt;sup>2</sup> (source: http://www.freertos.org/Stacks-and-stack-overflow-checking.html)

#### Task creation

```
xTaskCreate(
                                          task entry function
 MyTask,
 (signed char*)"MyTask",
                                          descriptive name for
                                          the task
 configMINIMAL_STACK_SIZE,
 (void*)myParam, 🔨
                                           size of the task stack -
 tskIDLE_PRIORITY,
                                           number of addressable units the stack
 &myTaskHandle
                                          can hold - not the number of bytes!
);
                                          parameter for the task
Call by macro
                                          priority of the task
portTask_FUNCTION(..)
                                          handle as reference for the task
static portTASK_FUNCTION(MyTask, pvParameters) {
 (void)pvParameters;
 for(;;) {
  EVNT_HandleEvents();
 } /* loop forever */
```

## Task Delay

#### Delay a task for a given number of ticks:

- vTaskDelay(500/portTICK\_RATE\_MS);
   Relative to the time at which vTaskDelay() is called.
- vTaskDelayUntil(&xLastWakeTime,500/portTICK\_RATE\_MS);
   Specifies a relative time at which the task wishes to unblock
